

## BannerGrip Installation Guide

### Top and Bottom Framing only:

Cut the BannerGrip to the width of the banner to be installed and attach it to the support wall using appropriate screws. Allow 50mm overlap of the banner at both the top and bottom for attachment. Use a level gauge to make sure the BannerGrip frames are square to each other and horizontal.

Starting at the top corner, and using short, (about 30mm) pieces of the plastic keeper, fold the fabric around the keeper and push into the BannerGrip channel using the insertion tool until the keeper clicks into place.

Using the same short keeper pieces at about 1 metre intervals, fix the banner into the top frame and adjust as necessary to align it.

Now lock the bottom side into the frame in the same way.

Return to the top corner and insert full strips of the keeper into the channel removing the short pieces as you go until both top and bottom are locked into place with the full length keeper strips.

To remove wrinkles simply release the fabric by levering the locked leg of the keeper out of the channel, pull tight and reinsert the keeper.

Finish off by trimming the loose fabric to about 10mm and roll the edge into the BannerGrip channel.

### Four Side Framing:

Attach the BannerGrip to all four sides of the support wall using either lap joints or mitred corners and allow 50mm banner overlap on all four sides. Cut off the banner corners to avoid bunching.

Install the banner exactly as described above leaving the two sides unattached until the top and bottom of the banner has been locked in place with full length keeper sections. Only then lock the sides in place using full length sections.

Trim off excess fabric and finish off as detailed in section 1.

To release the banner, starting from one corner pull the loose edge down towards the face of the banner releasing the keeper from the locking lip of the channel..
